(54) Title: SEPARATOR FOR SECONDARY BATTERY AND POROUS FILM MADE OF POLYOLEFIN BLEND AND PROCESS FOR PREPARING THE SAME

(57) Abstract

It is an object of the present invention to provide a microporous film made of polyolefin blend having outstanding electrolyte wettability, puncture strength, and shut down characteristics, its manufacturing method, and a secondary battery separator. The present invention provides a microporous film and a method for manufacturing the same characterized in that the microporous film is manufactured by molding a film with a mixed blend containing two or more of polyolefins by using a casting or film blowing, and that a microporous film is manufactured by annealing and stretching the molded film, and the microporous film is surface treated by irradiating it with ionizing radiation either before or after the pore formation in order to achieve the above object. Furthermore, the secondary batteries in which this microporous film is applied as a separator, especially lithium ion secondary batteries or alkali secondary batteries, are safer due to their outstanding puncture strength, shut down characteristics, and separator melt resistance under large external electric current flows, can benefit from a great increase in productivity due to the excellent separator electrolyte wettability during battery assembly, and can achieve high charging density due to their thin separator and high mechanical strength.
